

**How Magnetic Fields Can Play a Role in ExoClimes....  
.... perhaps**

- Signature of internal state
- Deflection of energetic particles from planet
- Delivery of energetic particles to the surface
- Delivery of energy to atmosphere – bombardment, joule heating
- Stripping of outer atmosphere

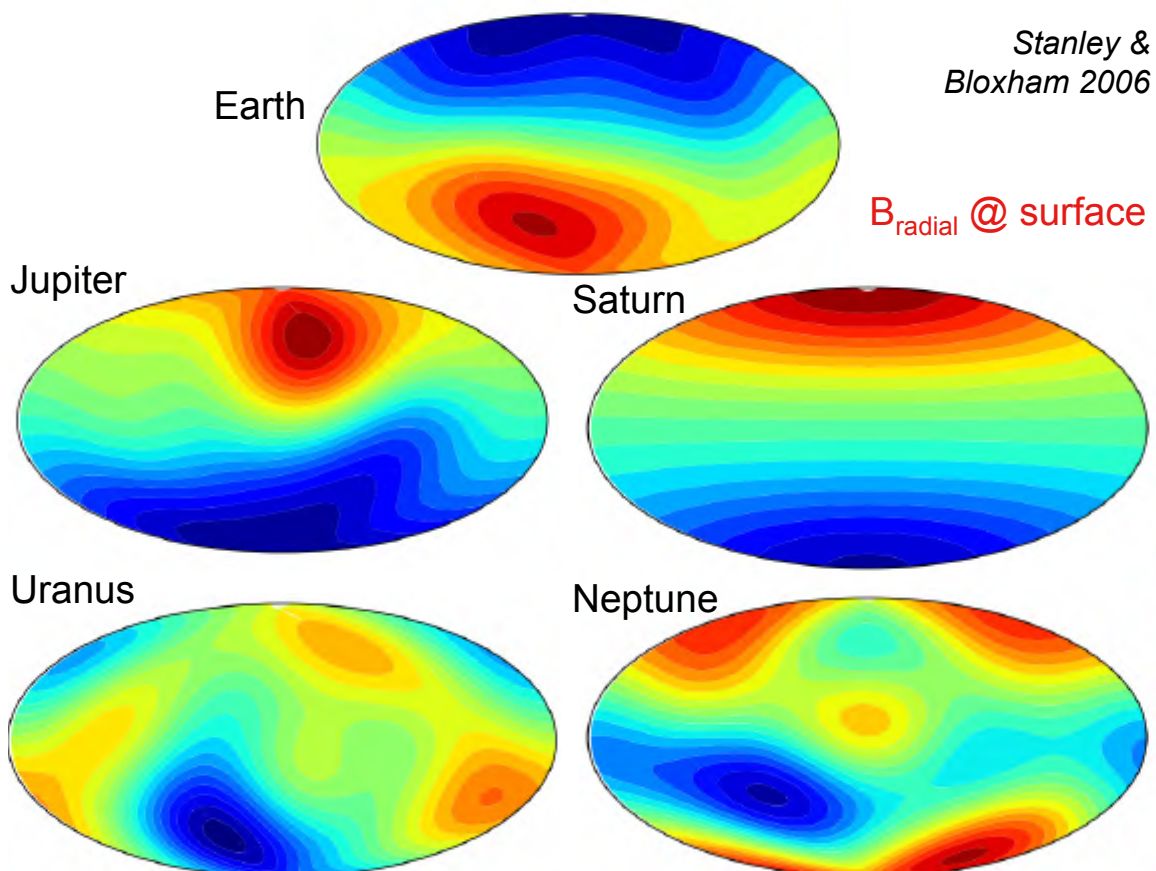

***Bottom line: Atmosphere protects biota from nasty energetic particles. The magnetosphere (mostly) protects the atmosphere.***

# Tilts and Obliquities

Offset Tilted Dipole Approximation

# Magnetic Potential 3-D harmonics

$$\mathbf{B} = -\text{grad } V$$

$$V = R_p \sum_{n=1}^{\infty} \sum_{m=0}^n \left(\frac{R_p}{r}\right)^{n+1} P_n^m(\cos \theta) (g_n^m \cos m\lambda + h_n^m \sin m\lambda), \quad (7.1)$$

coefficients - constants

functions

$$P_0^0(\cos \theta) = 1$$

$$P_1^0(\cos \theta) = \cos \theta$$

$$P_1^1(\cos \theta) = -\sin \theta$$

$$P_2^0(\cos \theta) = \frac{1}{2}(3 \cos^2 \theta - 1)$$

$$P_2^1(\cos \theta) = -3 \cos \theta \sin \theta$$

$$P_2^2(\cos \theta) = 3 \sin^2 \theta$$

$$P_3^0(\cos \theta) = \frac{1}{2}(5 \cos^3 \theta - 3 \cos \theta)$$

# Br through a reversal

Hulot et al. 2010  
Pavlov & Gallet 2005

Polarity reversals:

1. variable in duration and

2. rate

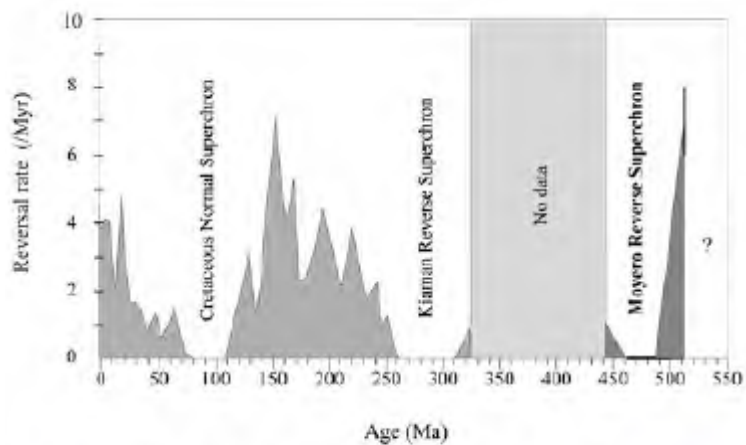

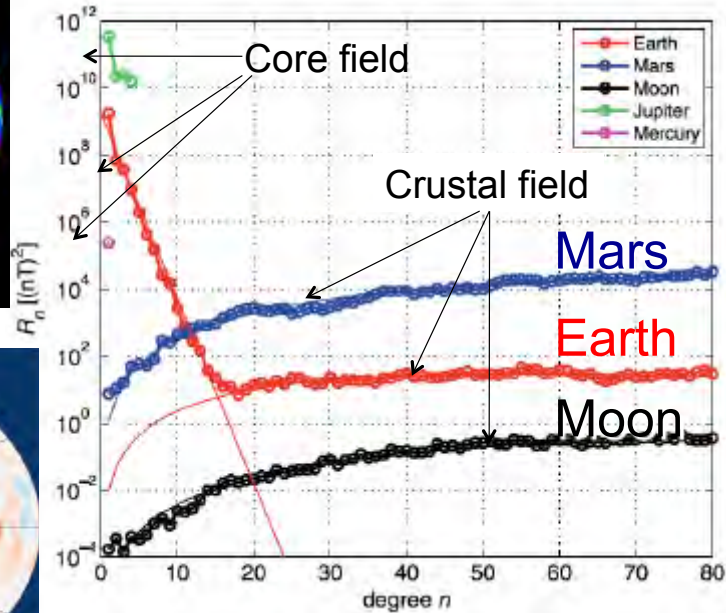

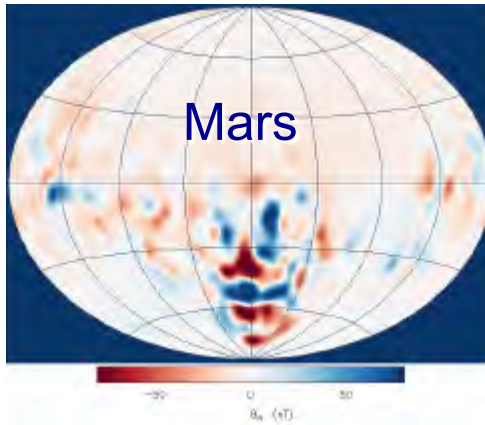

Fig. 29 Estimate of the reversal rate (in  $\text{Myr}^{-1}$ ) for the time interval 0–500 Ma, where reversal rates are estimated by geological stage, rather than by using a moving window average (as in Fig. 28), to harmonize

## Moon & Mars: All Crustal Remanent Magnetization

- Did Moon ever have dynamo?
- Mars' dynamo died >3.5 BYA.

Power spectra of the field of internal origin for the Earth (after Olsen et al. 2009a and Maus et al. 2008), Mars (after Cain et al. 2002), Jupiter (after Connerney 2002) and the Moon (after Purucker 2002) at their respective surface reference

Stanley & Glatzmeier 2010; Christensen 2010

## Planetary Dynamos

Volume of electrically  
conducting fluid ①  
which is convecting ②  
and rotating

All planetary objects  
probably have enough  
rotation - the presence  
(or not) of a global  
magnetic field tells us  
about ① and ②

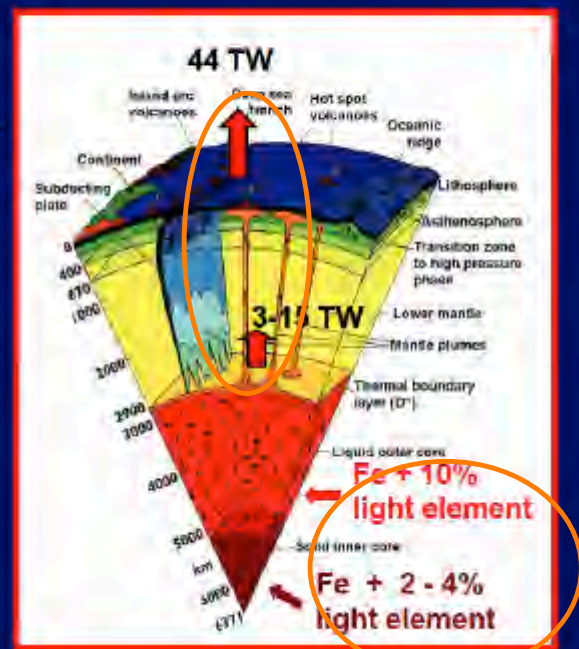

| Planet   | Dynamo          | $R_c/R_p$ | $B_o$ [nT] |
|----------|-----------------|-----------|------------|
| Mercury  | Yes (?)         | 0.75      | 195        |
| Venus    | No              | 0.55      |            |
| Earth    | Yes             | 0.55      | 31,000     |
| Moon     | No              | 0.2?      |            |
| Mars     | No, but in past | 0.5       |            |
| Ganymede | Yes             | 0.3?      | 720        |

*What drives dynamos in tiny Mercury & Ganymede?*

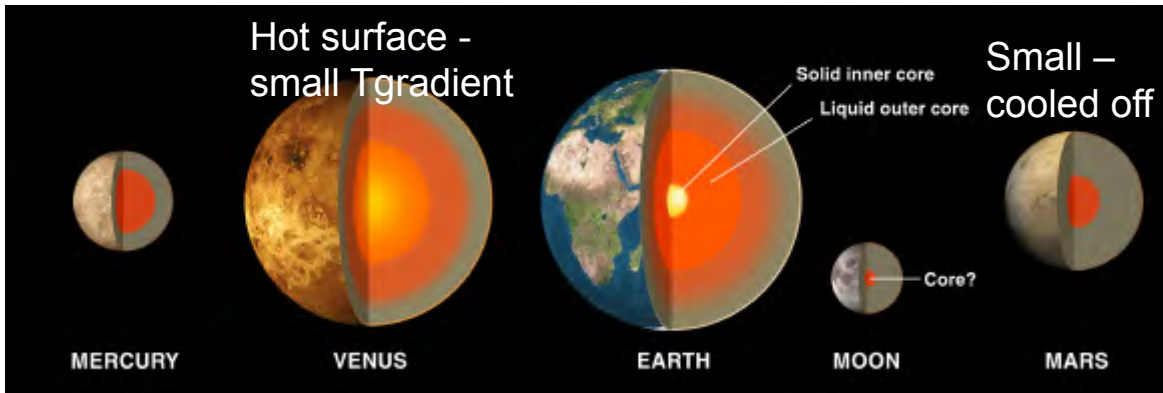

*Why don't Venus or Mars have dynamos?*

## Earth: Internal structure & energetics

- **Seismology: Dense core with  $R_c/R_p=0.55$**
- **Fe only cosmochemically abundant element matching density**
- **No shear waves in outer core, hence it is liquid**
- **Solid inner core with  $0.35R_c$**
- **~10% light element (Si, S, O, ...) in outer core, less in inner core**
- **Earth heat flow 44 TW. Core fraction estimated 3-15 TW**
- **Core heat flow mostly due to secular cooling**

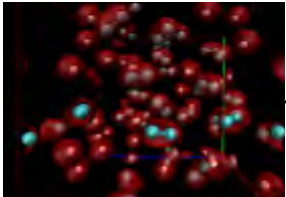

### Why Don't Venus or Mars have Dynamos?

- Enough rotation – even for Venus
- Conducting fluid core – probably
- Lack of convection in core?
  1. If....Mantle convection controls heat flow from core. Then....Lack of plate tectonics suggests less efficient cooling of interior and lower heat flux from core
  2. No inner core means no latent heat of solidification and no enhancement of lighter material in the outer core

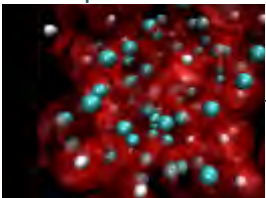

*Stevensen 2010*

*Jupiter*

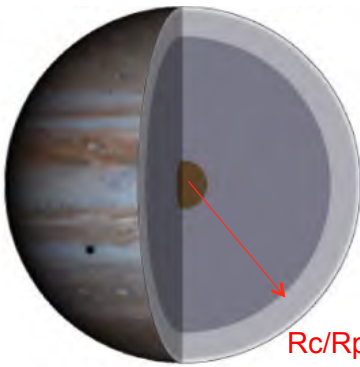

Molecular state

~2.5 Mbar phase transition

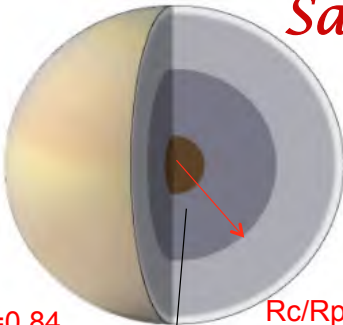

Plasma state

$R_c/R_p=0.84$

*Saturn*

$R_c/R_p=0.6$

Legend:

- Gaseous Hydrogen
- Liquid Hydrogen
- Metallic Hydrogen
- Rock

Saturn has lower mass

- lower pressures
- smaller region of metallic hydrogen
- weaker magnetic field

Uranus and Neptune have much less mass

- Lower pressures
- No metallic hydrogen
- Weak & irregular magnetic fields produced in water layer, deep below gas envelope

| Planet  | $R_c/R_p$ | $B_0$ [ $\mu T$ ] | Tilt   | Quad/<br>Dipole |
|---------|-----------|-------------------|--------|-----------------|
| Earth   | 0.55      | 31                | +9.92° | 0.04            |
| Jupiter | 0.84      | 428               | -9.6°  | 0.10            |
| Saturn  | 0.6       | 21                | <-1°   | 0.02            |
| Uranus  | 0.7       | 23                | -59°   | 1.3             |
| Neptune | 0.8       | 14                | -47°   | 2.7             |

\* Achilleos et al. 2008 # Joy et al. 2002

Earth ~ Dipole

$$R_{mp} \sim (\rho V^2)^{-1/6}$$

→ solar wind  $\rho V^2$

Jupiter

$$R_{mp} \sim (\rho V^2)^{-1/3}$$

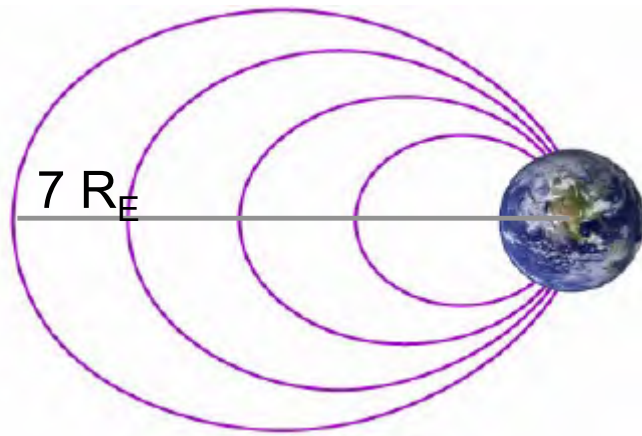

→ solar wind  $\rho V^2$

Earth ~ Dipole

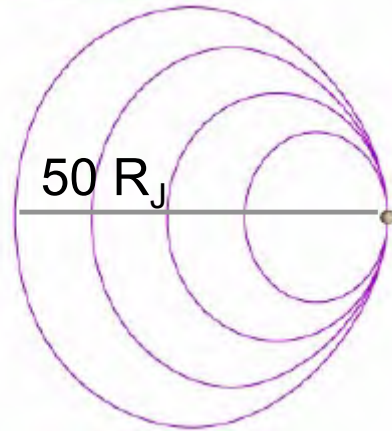

$R_{mp} \rightarrow 0.7 R_{MP}$

x10 Solar wind pressure

Jupiter

$R_{mp} \rightarrow 0.5 R_{MP}$

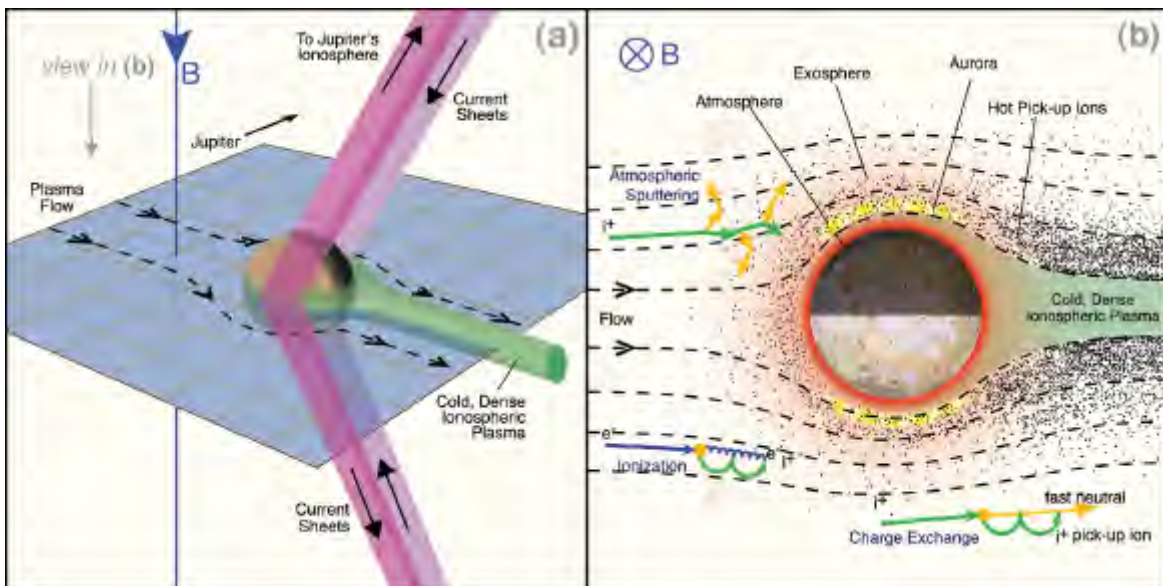

- Total mass 2 Mton
- Source 1 ton/s
- Replaced in 20-50 days

## Io Plasma Torus

Cassini UVIS  
Andrew Steffl

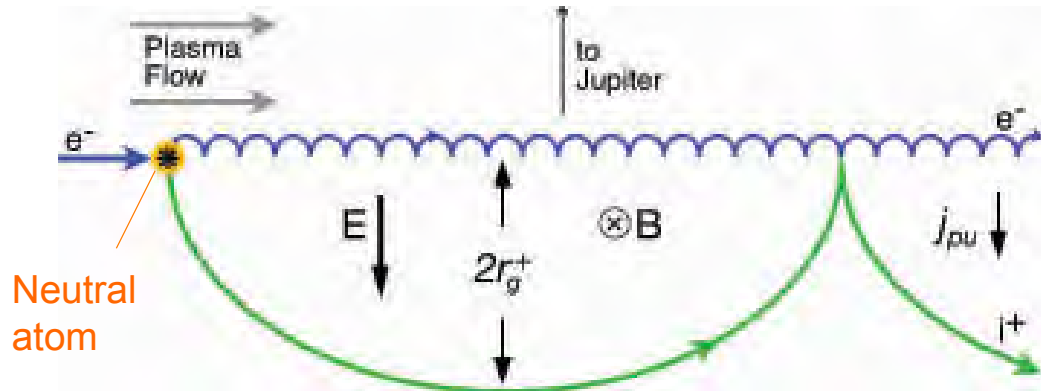

- Strong electrodynamic interaction
- Mega-amp currents between Io and Jupiter

- Plasma interaction with Io's atmosphere
- Heated atmosphere escapes
- ~20% plasma source local

- The magnetic field couples the plasma to the spinning planet

## Ion Pick Up

- New ions pick up thermal speed of of plasma flow in neutral rest frame

## Cassini UVIS

Steffl et al.  
2006, 2008

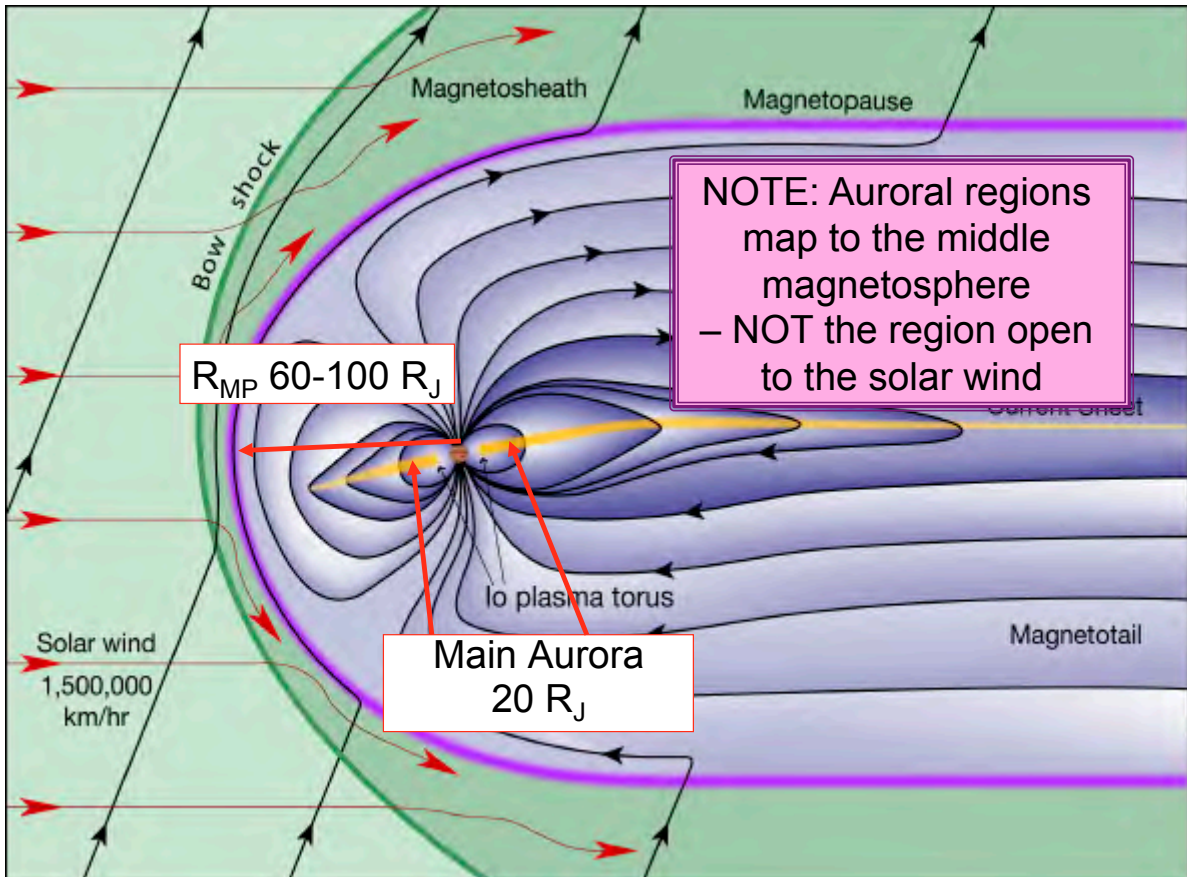

## Main Aurora

- Shape constant, fixed in magnetic co-ordinates
- Magnetic anomaly in north
- Steady intensity
- $\sim 1^\circ$  Narrow

Clarke et al., Grodent et al. HST

**The aurora is the signature of Jupiter's attempt to spin up its magnetosphere**

**Where is the clutch slipping?**

Mass loading

- A - Between deep and upper atmosphere?
- B - Between upper atmosphere and ionosphere?
- C - Lack of current-carriers in magnetosphere- $\rightarrow E_{\parallel}$ ?

Saturn's aurora

- strongly modulated by the solar wind
- open-closed boundary?

Clarke et al.

# Uranus & Neptune

- Highly asymmetric,
- Highly non-dipolar
- Complex transport (SW + rotation)
- Multiple plasma sources

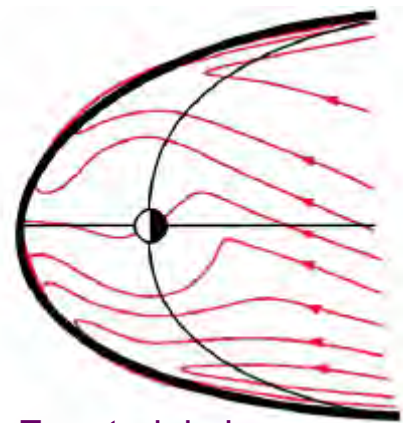

Highly asymmetric, non-dipole fields produce constantly-varying magnetospheric configurations:

little build-up of energetic particles

## EARTH: Solar Wind Driven Convection

Driven by Solar Wind  
Dissipated in Ionosphere-Thermosphere

Equatorial plane

Polar view

## Ionosphere - Thermosphere Poynting Flux

$$\int_A \vec{S} \cdot \hat{n} \, dA = \int_V \vec{J} \cdot \vec{E} \, dV$$

Kelley et al., *JGR*, Vol. 96, pp. 201-207, 1991

1/19/12

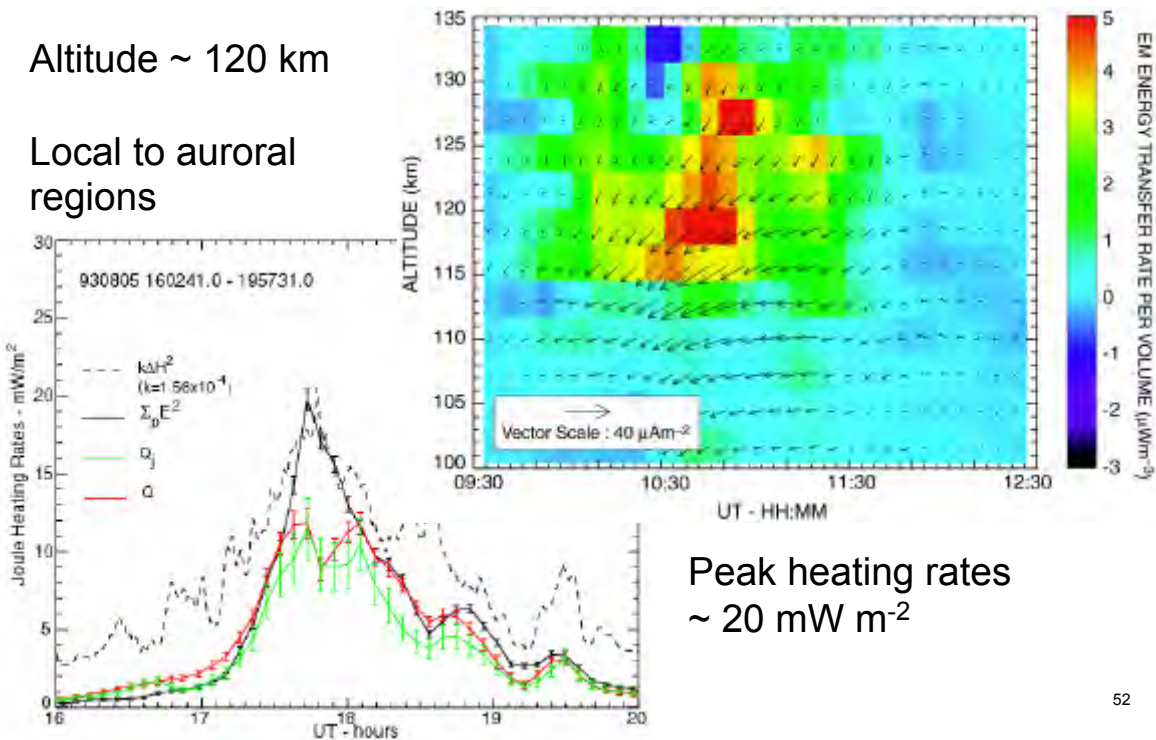

51

## Electromagnetic Energy Deposition

Altitude ~ 120 km

Local to auroral regions

Peak heating rates  
~ 20 mW m<sup>-2</sup>

52

|  | Earth     | Jupiter   | Saturn    | Uranus | Neptune |
|--|-----------|-----------|-----------|--------|---------|
| Auroral Emission (Watts)                             | $10^{10}$ | $10^{12}$ | $10^{11}$ | $10^9$ | $10^7$  |
| Energy deposited in atmosphere ~ 10-100 times larger |           |           |           |        |         |

*Pressure Balance:*

Solar wind ram pressure

-> compressed IMF

-> magnetic pressure

vs. ionospheric thermal pressure

**VENUS**

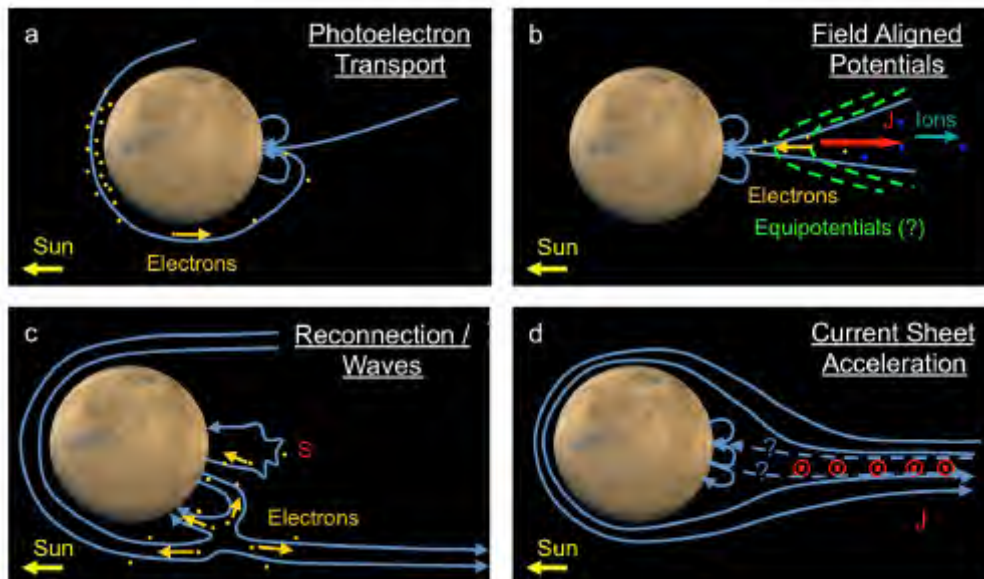

Mars

Brain & Helekas 2012

### Possible mechanisms for Mars' aurora

Total auroral precipitated power  $\sim mW m^{-2}$

## Electron fluxes onto Mars' atmosphere – focussed by magnetic fields

- Total energy flux  $\sim \text{mW m}^{-2}$
- Outflow estimates  $10^{23-25} \text{ s}^{-1}$
- Probably higher for early Mars

Total atmospheric  
escape  
 $\sim 1 \text{ ton/hour} - ???$

### MAVEN:

- Launch Nov. 2013
- Orbits Mars Sept. 2014-2016
- PI Bruce Jakosky  
U of Colorado

Goal:  
To quantify the  
processes driving  
atmospheric escape  
- both now, and allow  
extrapolation into past  
history

# Summary

- Diverse planetary magnetic fields & magnetospheres
- Dynamo primarily requires region of liquid conducting material that is convecting – generally limited by heat flow out of core
- Earth, Mercury, Ganymede magnetospheres driven by reconnection
- Jupiter & Saturn driven by rotation & internal sources of plasma
- Uranus & Neptune are complex – need to be explored!
- **Atmospheric escape driven by plasma interactions is very poorly understood – be careful!**

# Juno

Microwave Radiometer (JPL)  
Magnetometer (GSFC/JPL)  
Energetic Particle Detector (APL)  
Plasma (SwRI)  
Waves (Iowa)  
UV Spectrometer (SwRI)  
IR Spectral Imager (Rome)  
Visible Camera (Malin)

Launch 2011  
Arrive 2016

## Juno Mission Design

**Launch: August 2011**

**5 year cruise**

**Baseline mission:**

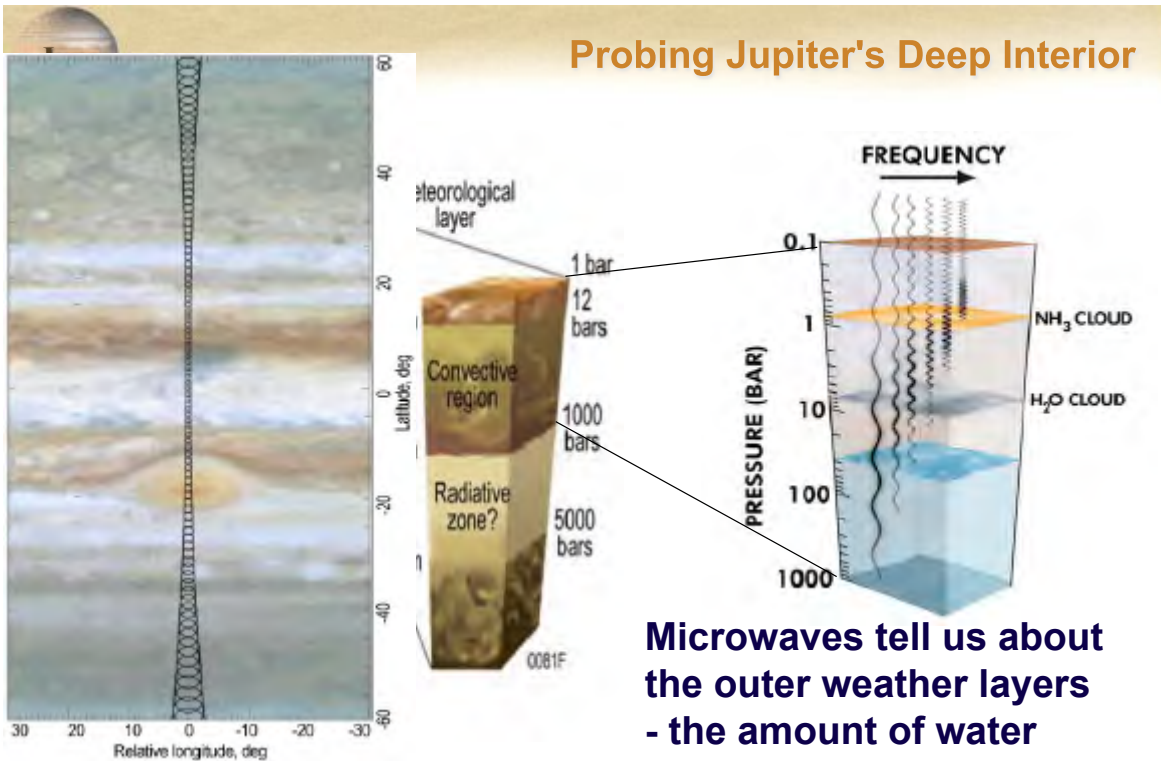

- 32 polar orbits
- Perijove ~5000 km
- 11 day period
- Spinner
- Solar-powered

**Science Objectives:**

- Origin of Jupiter
- Interior Structure
- Atmosphere Composition & Dynamics
- Polar Magnetosphere

## Probing Jupiter's Deep Interior

**Microwaves tell us about the outer weather layers - the amount of water**

**Magnetic and Gravity Fields tell us about the deep interior**

Juno

## Polar Magnetosphere

Juno passes directly through auroral field lines

Measures particles precipitating into atmosphere creating aurora

Plasma/radio waves reveal processes responsible for particle acceleration

UV & IR images provides context for *in-situ* observations

$$R_{CF}/R_p \sim \{B_o^2 / 2 \mu_o \rho_{sw} V_{sw}^2\}^{1/6}$$
